

# APPROACHES TO QUESTIONING THAT ENABLE STUDENTS' MODELLING DEVELOPMENT

SHARON DAVIDSON

 **ACU** INSTITUTE FOR  
LEARNING SCIENCES  
& TEACHER EDUCATION

1

 **ACU** INSTITUTE FOR  
LEARNING SCIENCES  
& TEACHER EDUCATION

## Project takeaways

### What I thought...

Assessments (or ideas) I could use in  
middle and senior years

How best to implement assignments

How to write a mathematical report

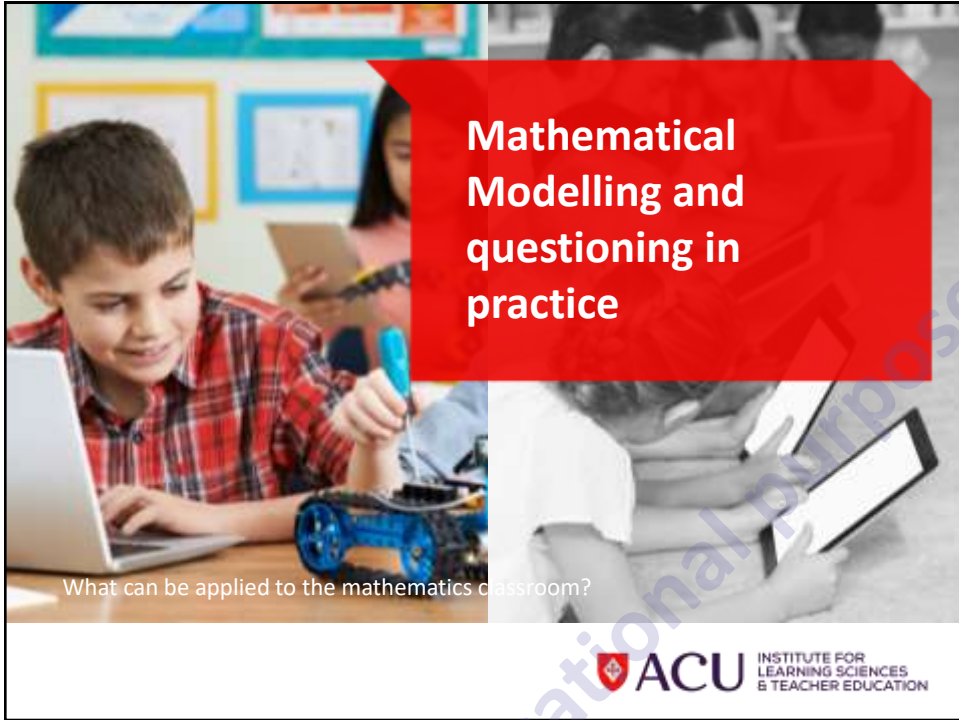

### What I got...

Better understanding of the problem-  
solving process

Realisation of how I used questioning  
as part of the process

Value of focusing on the process to  
help students become independent  
modellers

2

## Mathematical Modelling and questioning in practice

What can be applied to the mathematics classroom?

 **ACU** INSTITUTE FOR LEARNING SCIENCES & TEACHER EDUCATION

3

## Setting the scene

© 2021 Australian Council of Educational Research Institutes | Breakout 3 | Enablers Symposium, May 2021 For non-commercial educational purposes only

4

## Initial Phase

### IS IT WORTH THE TRIP?

Name of Petrol Station	Petrol Cost (per litre)
F Elson (Abing-Clack)	130.7
BP (Alford) (Widmore Rd BP)	133.7
Suffolk	135.6
Rural Petrol Park	125.7

His car has the following attributes –  
 Car: Toyota Yaris Ascent Hatch Manual  
 Fuel Tank: 42 L  
 Fuel Consumption: 7.1L / 100km or 14.08km/L  
 Current Fuel Tank Level: about 4 L  
**Which Petrol Station is the best choice for Sam?**

- Open-ended
- Genuine link to the real world
- Mathematically accessible

5

## Preparedness

### Students

- Visitors coming to watch how they solved problems
- Linked the experience assessment – senior and upcoming
- No interaction with actual process

### Teacher

- Engaged with the problem and developed a solution
- Engaged with the framework for design and implementation
- Focused on the suggested questions within the framework

6

Enabling effective modelling through questioning		ACU INSTITUTE FOR LEARNING SCIENCES & TEACHER EDUCATION
	<p>question as well as other observations such as trends in data, dimensional analysis, etc. Outcomes should be reported back to whole class by a group representative.</p> <ul style="list-style-type: none"> <li>Teacher synthesises/prioritises student's initial assumptions and variables sufficient to begin modelling process for an initial model.</li> </ul>	<ul style="list-style-type: none"> <li>There should be a focus on student decision making – with no prior indications of what the outcome of the problem is or what mathematical content they should address.</li> <li>Students should be encouraged to pose significant questions to the teacher or the peerwork as well.</li> </ul>
Body of Lesson	<p>Students:</p> <ul style="list-style-type: none"> <li>Proceed in their groups to create model, solve, interpret, etc. in terms of the question they are addressing.</li> <li>Engage in productive student-student collaboration.</li> <li>Identify and make productive use of technology where applicable, for example, to source relevant information, check calculations and/or generate solutions.</li> <li>Devise a record of their progress in terms of the stages of the modelling process (e.g. from <b>Teach</b> to <b>Act</b>).</li> <li><b>Employ measured responsiveness – rather than providing specific advice about the problem. teachers should prompt students to think about where they are in the modelling process. Structure mathematical questions that promote a viable solution pathway.</b></li> </ul> <p>Teacher and acting young or non-peer: (1) What would the students be making themselves at this point in the modelling process?</p> <ul style="list-style-type: none"> <li>Support students with making progress through the modelling process.</li> <li>Anticipate where students might have problems, e.g., interpreting the problem, generalising the solution.</li> </ul> <p>Responses to students' questions or requests for assistance could include: What are you doing? What are you trying to do?; Where are you in the modelling process?; How have you checked your answer? (both mathematically and in terms of context); Can your solution be generalized?</p>	<p>Points that may be considered by students:</p> <ol style="list-style-type: none"> <li>Documenting progress against a visual representation of the modelling process. Problem statement → Formulate → Mathematical solutions → Interpreting outcomes → Evaluation.</li> <li>Forms of collaboration: Working separately and then coming together; Working together from the beginning; Negotiating/confirming consensus; Explaining external to the group (Teacher/Assessor – Student). Students also encouraged</li> </ol> <p>Responses to students' questions or requests for assistance could include: What are you doing? What are you trying to do?; Where are you in the modelling process?; How have you checked your answer? (both mathematically and in terms of context); Can your solution be generalized?</p>
Class Presentation of findings and teacher summary	<ul style="list-style-type: none"> <li>spokesperson). Findings should be reported in a concise fashion (e.g., via 3–5-minute video).</li> <li>Teacher/student ask questions of clarification as required or to test arguments.</li> </ul>	<ul style="list-style-type: none"> <li>Students in the audience should provide commentary that includes questions, elaborations, clarifications (e.g., each student to write down one question or comment about the presented model).</li> <li>Comments could also be directed towards criteria related to making judgements about the quality of the presentation of findings (e.g., Problem statement → Formulate → Mathematical solutions → Interpreting outcomes → Evaluation). All students should have access to these criteria.</li> <li>Teacher clarifications questions can include: How does that work with your model? (e.g., whether an identified error). Will your solution work for other situations?</li> </ul>

## What happened...

- Students solved the problem (!!)
- The process was undirected – nothing to refer to
- No progression or process leading to a written outcome
- Opportunity to hear the type of questions I asked

## What I learned...

- Activate my teacher meta-meta cognition
- Students were not independent modelers
- Rethink my intended learning outcome
- Not as good at questioning as I thought

## Second Phase

The focus of this task is on the new foundations that were built to support the "new" Las Arenas. If you look at the Figure 1, you will see that the lower section of Las Arenas is made of concrete. These are the new foundations in question.

As you can imagine, this was a time-consuming and costly project. The following table offers an overview of the renovation details:

Floors 5	E-forum 5.500m <sup>2</sup>	Building Diameter 100 m
Stores 100	Gross Floor Area 105.816 m <sup>2</sup>	Roof Dome Diameter 96 m
Commercial area 31.978 m <sup>2</sup>	Foundation Height 4.25 m	Construction Cost €105.000.000
Building 46.973m <sup>2</sup>	Foundation thickness 5 m	Dome Height 27 m

Feel free to make use of this table and whatever information you can find about Las Arenas on the internet to complete the task below. The websites provided are good starting points:

*What would be the current cost of constructing the concrete foundations?*

## Preparedness

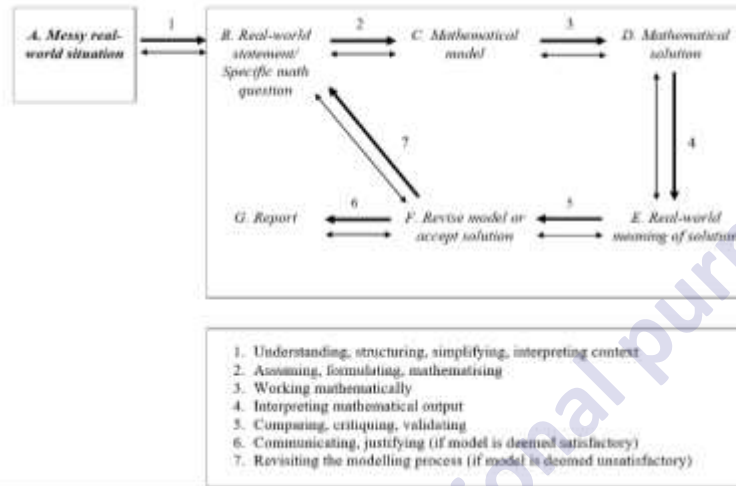

### Students

- Engaged with the process – explicitly introduced in class

### Teacher

## The process of mathematical modelling

## Preparedness

### Students

- Engaged with the process – explicitly introduced in class
- Explain that getting stuck is a natural part of the modelling process
- Reduced the expectation that I would give the answers

### Teacher

- Worked through the problem, planning my questioning at each stage by considering when and why

## FORMULATE

- What do you know?
- What don't you know?
  - Where could you find this information?
  - Can we make an assumption about this?
- What mathematics do you know that could be applied here?
  - Have you solved a problem like this before?
  - What have we been working on that might help?

WHAT ELSE? WHAT ELSE? WHAT ELSE?

## SOLVE

- How did you come to ...?
- Why did you decide that...?
- Considering where you are at now, what can you keep, what do you need to reconsider?
- What do you think the next step is?
- How does this maths relate to the context, contribute to the final solution?
- Knowing the students in my class:  
What does ..... think?

## INTERPRET AND EVALUATE (VERIFY)

- Has this group solved the problem? How do you know that?
- Have they considered all aspects of the problem? Can you give them feedback on what they have missed?
- Could a similar process be used to solve another problem?
- How does this solution compare to your solution?

## What happened...

- Students solved the problem (!!!)
- Students had more confidence in moving through the stages of the process
- Time was against us – time limits were set in each section
- Improvement in recording of information and answers – not so much in decision making

## EVALUATE... Some Examples

*Did your solution solve the problem?*  
Yes

*Did your solution solve the problem?*  
Yes, our solution did solve the problem

**Did your solution solve the problem?**

**Mostly, except for any labour and travel costs required to assemble the arena.**

## What I learned...

- Collaboration page was successful – allowed collection of everyone’s ideas
- Encourage seeking answers – What do modellers do?  
– What questions can I ask to get to the next stage?
- Issues recording information – importance of including wrong answers, documenting when they changed directions

## What I learned...

- Collaboration page was successful – allowed collection of everyone’s ideas
- Encourage seeking answers – What do modellers do? – What questions can I ask to get to the next stage?
- Issues recording information – importance of including wrong answers, documenting when they changed directions

21

## Overarching – Questioning Techniques

- Changing the culture
- Assessment design
- Focus on anticipation
- Trusting the process

22

## Student Focus

- Include activities that allow students to take risks and that have more than one answer
- Introduce the language early
- Focus on the process in junior and middle years
- Provide students with ways to ask questions to increase their own understanding

## Teacher Focus

- Questioning techniques – department project – How and when do we ask questions?
- Assignment design – solution as a team – anticipation
- Drafting process to develop a calibration document

## Modelling Process Focus

- Grade 6 – 7 (and 8)
  - Problem solving lessons – youcubed, IMMC, Mathspace
  - Focus on patterns leading to generalisations
- Grade 9 and 10
  - Modified the QCAA essential maths booklet as template for assignment
  - Year 9 – focus on writing, making links between formulate and evaluate sections
  - Year 10 – focus on what adds values to the report (include and exclude), use of appendices
